

Private by design

Quantis is an invitation-only demonstration with simulated prices, curated headlines, and no brokerage, custody, payment, or order-execution capability.

- **Secure sessions**

Digested credentials, cryptographic randomness, secure cookies, and rate limits.

- **Minimal data**

Invitation, request, session, and watchlist information only.

- **Private source**

The implementation remains outside the public showcase repository.

QUANTIS

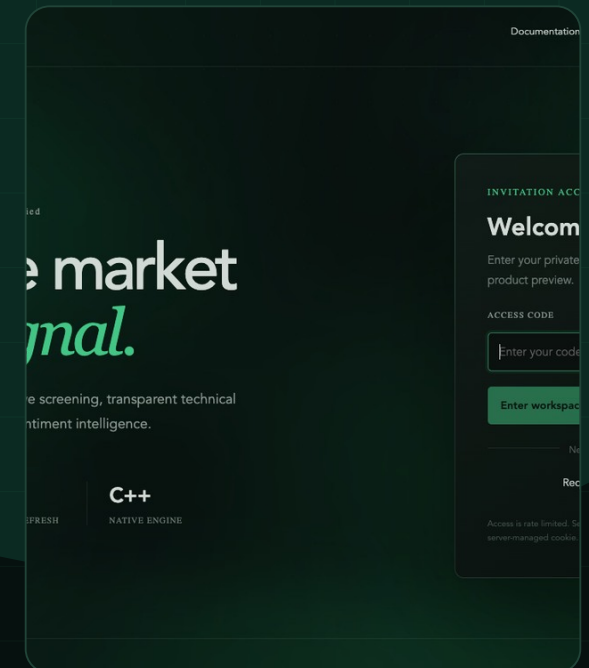

PRODUCT BRIEF

See the market with *signal.*

Market intelligence built around a native C++20 analytical core.

CATEGORY	DESCRIPTION
technical	Measures the balance of recent gains and losses
technical	Compares fast and slow exponential moving averages
technical	Tracks convergence and divergence between price and moving averages
technical	Locates price within a two-standard-deviation band
technical	Compares current activity with the instrument's historical volatility
technical	Classifies short-horizon realized volatility
sentiment	Scores curated headlines with a transparency metric
sentiment	Gives newer headlines more influence than older ones
sentiment	Measures directional agreement across different sources
sentiment	Highlights disagreement between price direction and sentiment

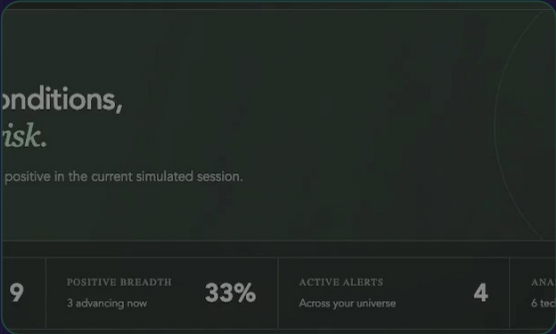

NATIVE C++20 CLI / SUPPORTED TODAY

One analytical core

The C++20 engine owns state, history, risk, alerts, and analysis. Interface layers render typed results rather than recalculating signals.

- **Technical**
RSI, EMA crossover, MACD, Bollinger position, relative volume, and volatility regime.
- **Sentiment**
Headline polarity, recency weighting, source consensus, and price-sentiment divergence.
- **Interpretable**
Signal, score, confidence, value, summary, and supporting insights.

Three delivery surfaces

NATIVE CLI

Modules, analysis, local watchlists, snapshots, and one-second live monitoring.

REST API

Profiles, snapshots, modules, analysis, streaming, and synchronized watchlists.

WEB WORKSPACE

Overview, screener, technical, sentiment, and controlled-access workflows.

Same modules. Same semantics. Every surface.

The registry is the contract; the product experience changes, the analytical truth does not.

From demo to full suite

The full-suite direction expands the operational envelope while preserving the engine boundary.

- Licensed live and historical market data
- Active news and X intelligence
- Stocks, ETFs, and crypto
- Private and consultant workspaces
- Read-only brokerage and wallet connections
- Live charts, alerts, terminal, and device sync

DESIGN TARGETS

10,000 profiles / 1,000 concurrent users / 99.9% availability objective / 250 instruments per profile

Targets are directional and are not claims of present capacity, certification, or integration availability.
